Preface

The book comprehensively explores water quality, encompassing the various types of pollution, including physicochemical parameters, geogenic pollutants like arsenic and fluoride, radionuclides, heavy metals, and microplastics. Through diverse research, reviews, and case studies worldwide, this compilation tackles critical topics such as statistical trends in water quality, economic impacts, groundwater management, and radiation effects on marine ecosystems. Moreover, it also includes studies that explore heavy metal pollution, health risk assessments, and remediation techniques, emphasizing the need for effective solutions while examining the role of geospatial technologies and pollution indices in effectively evaluating and managing groundwater resources. This research also aligns with the United Nations Sustainable Development Goals, specifically Goal 3: Ensure Healthy Lives and Goal 6: Ensure Access to Water and Sanitation, contributing to the global effort to address the water crisis. It is an invaluable resource for students, researchers, policymakers, and planners seeking to ensure safe and sustainable water resources by entailing a broad spectrum of global research.
